

40/40

During this project, I learned the difficulties of using html, php and sql together. Since it was my first time using php ever, and my first time using html after 6 years, I found the integration of the two to be quite difficult. Especially so since I decided to start this project very very late. Many of my issues had to do with improper php usage for sending sql queries while surprisingly few of them had to do with actual integration of php and html. I tried my hardest to reduce the amount of echo statements I needed because writing html within another language just seemed like such a pain, especially when there were lots of embedded quotation marks and apostrophes. However, I do believe that I did a good job integrating the two and catching cases where bad insertions or deletions happened. In order to not have to deal with excessive embedded html inside my php, I took the liberty of having those cases simply return back to the main page without actually making an SQL modification to the database's table. Given more time, I would have liked to mess around with the extra credit UI portion of the project. Maybe I can do that for my DBMS project though....
